IDENTIFIERS English Language Books By Title; Library of Congress; National Union Catalog

ABSTRACT

A timed comparison was made of two methods of searching. Five bibliographic searchers timed themselves while searching by possible main entries in the National Union Catalog. The authors then timed themselves searching the same items by title in the English Language Books by Title and in Library of Congress National Program for Acquisitions and Cataloging (LC NPAC) depository card file arranged by title. Comparisons revealed that, for a sample size of 771 items, searching by main entries in the National Union Catalog is 89.3 percent slower than searching by title in the LC NPAC file, and it is 84.8 percent slower than searching by title in the English Language Books by Title. ACKNOWLEDGMENTS

The authors express thanks to Dr. M. Nabil Hamdy, Associate Professor, Graduate School of Librarianship, University of Denver, for suggesting this study; Robert Ortiz for suggestions and guidance; and D. Ivan Timm, Louella Farbes, and Judy Holley, fellow searchers in the Acquisitions Department whose endurance and cooperation made this study possible. A special thanks to Mrs. Harriet Ortiz whose support was greatly appreciated.

The authors would also like to express appreciation to Penrose Library, University of Denver, particularly Mr. John Bratton, Head, Acquisitions Department and Norlin Library, University of Colorado Libraries, Boulder, Colorado, particularly Mr. Eugene Petriwsky, Catalog Department Head, Ms. Harriet Rebuldela, Acquisitions Department Head, and Paul Sheldon, Catalog Maintenance Department Head.

CHAPTER I

INTRODUCTION

Background

The bibliographic searcher in any library has a variety of information to gather and a variety of tasks to perform both in the gathering of that information and as a result of that information. Most generally, the bibliographic searcher has the following duties:

1. To establish the exact author and title of the item under consideration.
2. To establish its relationship, if any, to other editions of the same title.
3. To establish its bibliographic history, e.g., whether it is identical or closely related to another work published under a different title, belongs to a series of works, or is part of another work.
4. To determine whether or not the library already possesses a copy of the work, another edition or translation, or the whole of which it is a part.
5. To determine the cost of the work and the source from which it can be obtained.
6. To determine what the correct entry will be.[1]

The terms "bibliographic searching" or "searching" are more narrowly construed for the purposes of this introductory discussion to mean

"looking for an LC card for a particular item through bibliographic tools containing LC cards."[2]

The ultimate goal of searching in many libraries, including the Penrose Library at the University of Denver, is the pre-cataloging of the item. Normally, pre-cataloging involves the locating of an LC card for the item in the National Union Catalog (the NUC), i.e. locating a "match." The LC card is then reproduced, yielding "LC copy",[3] or a note is made as to where "LC"[4] can be found for future reproduction. In the case of an item in hand, LC copy is sent to the Cataloging Department along with the item. In the case of a request, a note is made on the request form as to where LC can be found. When the item arrives LC is located, a picture of it is taken, and the LC copy is then sent to Cataloging along with the item.

Problem Statement I: Main Entry Searching

In order to search the NUC effectively, the searcher must know not only precisely what item he is looking for but also precisely how that item might be represented in the NUC. The NUC, unlike public card catalogs, is a single-entry catalog whose single entry is a main entry determined by Library of Congress catalogers using ALA and AACR rules for main entry as applicable under the policy of superimposition. The AACR gives two definitions for main entry: 1) "The complete catalog record of a bibliographic entity, presented in the form by which the entity is to be uniformly identified and cited," and 2) "the heading under which such a record is represented in the catalog or, if there is no heading, the title."[5] In this study, the term "main entry" is used in the second sense, as a heading.

Under LC's policy of superimposition, a main entry is established by AACR rules only if no main entry has been established under the older ALA rules used previous to the adoption of the AACR rules.[6] Since both sets of rules are generally compatible, the bibliographic searcher at Penrose Library uses the AACR rules to judge possible main entries to guide his search.

The searcher, therefore, must not only be alert to that entry which is most likely to be the main entry, but also be alert to the possibility that under AACR rules a number of entries may be good candidates for selection as the main entry for a particular item. The partial or complete proceedings of a symposium, for example, may be entered under the name of the symposium, under the name of an editor, or under the distinct title of the item containing those proceedings.[7] In many areas AACR rules are so vague as to the choice of a main entry that the cataloger must use what he considers to be good judgment in the selection of his main entry. As M. Nabil Hamdy has concluded in a recent study of the AACR rules:

> Above all it is clear that the determination of the main entries according to the rules is a rather complex process and one which can result in inconsistent, arbitrary or subjective decisions. The selection of the main entry, as specified by the rules, requires a considerable amount of decision making and searching through reference sources, which is both time-consuming and costly."[8]

Similarly, the searching of an item through the NUC by possible main entries is both time-consuming and costly. The bibliographic searcher, being a sub-professional and being expected to find a match as quickly as possible, does not normally have the time to sit down with the AACR rules in hand and interpret them for each item he

searches. The searcher must instead rely on his general knowledge of the AACR rules and on his experience. He is, therefore, forced to list and search all the possible entries that in his judgment a Library of Congress cataloger might select as the main entry. Since there might be a number of author and corporate possibilities for main entry (as well as the possibility of title main entry) and since the names of authors and corporate bodies are subject to formalization under one or the other sets of rules used by the Library of Congress, as many as four possible main entries may confront the searcher and having to search five possible main entries for one item is not unheard of.

Problem Statement II: Title Searching

It is more and more being suggested by persons knowledgable in the library world that a search by title through a title access tool would be quicker and cheaper than a search by main entry or possible main entries through the NUC. The advantage of title access is obvious: in the vast majority of cases the searcher would be required to search only one bit of bibliographic information in order to locate the entire LC card. Occasionally two titles would have to be searched if the item had a distinctive title and were part of a set with a different title that the Library of Congress may have cataloged as a set or if the title of the item were unclear due to its presentation on the title page. A number of other circumstances might require a two-title search for an item, but an item having more than two possible titles is extremely rare.[9] Moreover, the searcher would have to be familiar only with those rules pertaining to the

recording of the title and these rules are considerably simpler than the rules for main entry.

A number of studies have been done which demonstrate the desirability of title access for the benefit of library patrons as well as bibliographic searchers. One such study, carried out at the University of Michigan by Tagliacozzo et al., reports that "the chance that a user would approach the catalogue with perfect or nearly perfect information is much higher in the case of titles than in the case of authors (70.0% v. 41.0%)."[10] Another study, done at the Atomic Weapons Research Establishment, Aldermaston, England, by Ayers et al., reports that, "...the title information was completely accurate for more than 90% of the sample, while the comparable figure for author information was under 75%."[11] Elizabeth Tate, in a study examining, "...the American library catalog in terms of its efficiency in locating books," reports simply that, "...the title is a more efficient finding device than the main entry..."[12] If the title is so superior to main entry in the location of items, it is only logical to exploit this superiority in order to make the bibliographic searcher's search through single-entry catalogs quicker and less costly.

In a time when bibliographic control is being hampered by slow and cumbersome cataloging rules that cannot keep up with the deluge of items being published and when library budgets for routine cataloging functions are being strained and even cut, libraries are becoming less interested in preserving the literary unit and more interested in being able to quickly and inexpensively locate a particular item. The recent vote of the National Program for Acquisi-

tions and Cataloging (NPAC) libraries to have depository cards from LC arranged by title rather than by main entry and OCLC's on-line title access capability are demonstrations of the demand for and the utility of title access tools. Moreover, the recent publication of Gale's English Language Books by Title[13] (1970), of Abel's MARC Plus: A Cataloging Service[14] (1973), and of Information Dynamics Corporation's LC/Title Register[15] (1973) are evidence that libraries are creating a commercial market for tools that permit the efficient location of bibliographic information. Hopefully, the results of this study will show not only that the research methodology adopted is a valid one, but also that the title approach to bibliographic searching, and beyond that to the bibliographic control of materials, is a practical and relatively inexpensive approach that ought to be tried.

Justification of the Study

This study was suggested to the authors by Dr. M. Nabil Hamdy, Associate Professor of Library Science, Graduate School of Librarianship, University of Denver. A literature search following Dr. Hamdy's suggestion revealed a complete lack of literature on the time and cost involved in searching by main entry versus the time and cost involved in searching by title. In a less formal sense, the study is further justified by the personal interest of the authors, both of whom are bibliographic searchers at the Penrose Library, University of Denver, and thus well aware of the great amount of time and money that goes into the main entry searching method used by the library.

Methodology

This study is to develop reliable data for the expression of time and cost of bibliographic searching. If this study is to develop such data, it must be concerned with the control of the following variables:

1. Who is to do the searching?
2. What is to be searched?
3. Where is the searching to be done?
4. What is the method of searching used?
5. What tools are to be used in searching?
6. What type of data is to be collected?
7. How is the data to be analyzed?

These variables as listed above suggest the discussion which follows.

The searching was done by five bibliographic searchers at the University of Denver, Penrose Library, Acquisitions Department. The authors shall assume that each searcher is competent; however, the data collected supplies enough information to include correction for varying competencies.

The material searched was selected from those library materials received by the Acquisitions Department from January to March 1973. All materials that were searched by the five bibliographic searchers, and that were estimated or known to have an imprint date of 1969 or later were included in the sample. The only restriction which was placed, but never met, was that the sample size should not exceed 1,000.

The searching was done in two libraries and three locations.

First the samples were searched by the five searchers at the bibliographies section of the reference collection, Penrose Library, using the Library of Congress' National Union Catalog (NUC) whose entry access is the main entry. The sample was then taken to the University of Colorado Norlin Library, Catalog Department, where it was searched by one of the authors through the file of Title II (T II) L.C. Depository Cards whose entry access is title. The same sample was then taken to the Penrose Library Acquisitions Department and searched by the other author through the Gale Research Company's English Language Books by Title (ELBT) whose entry access is title. Prior to searching in ELBT the sample was modified to conform to the limitations of this tool--all foreign language titles and all those titles whose imprint dates were estimated or known not to be between 1969-1971 were removed from the sample. Through this process, the sample size was reduced from 771 to 307.

The method of searching was therefore defined in two entry access modes. One was by title in the ELBT and T II. The other was by main entry in the NUC.

The searching in the ELBT and T II was done by the authors since it would have been detrimental for Penrose Library to allow the five searchers to re-search items in the ELBT and T II after having searched the items in the NUC.

In order to carry out the actual timing for each search the five searchers were given a two page manual entitled, "Search Rules." (See Appendix C, p. 100) This contains four main sections: a) objectives, b) general instructions, c) search methodology and d) timing methodology. A general meeting was held of those to be involved in

the search at which time the searchers were given an opportunity to question any statements they felt were unclear or ambiguous. Stopwatches were then made available to the searchers and the sample search began.

Since the entire searching process and the physical location of bibliographic tools vary from library to library, only the time involved in the search through the three tools (NUC, T II, and ELBT) was timed. The authors realize that this is only part of the total search mechanism.

The tools used for searching in this study were the Library of Congress' National Union Catalog, the Title II Library of Congress' Depository Card file, and the Gale Research Company's, English Language Books by Title. They are discussed in greater detail in the following section.

The type of data to be collected by the five searchers was explained in a second general meeting. The authors asked the searchers to do the following things: 1) continue to supply the cataloging department with pre-cataloging information, 2) time their search in the NUC with a stopwatch, 3) record this time in the appropriate place on the data sheet. (See "Search Rules", p. 2, Appendix C, p, 101), 4) record only a perfect match and identify it with a (✓) on the data sheet in the NUC search, and 5) make out a separate data sheet for each of the possible main entries searched. The data sheet was then submitted to careful scrutiny by the searchers and all questions were discussed.

The cost analysis by time variance method used in this study was chosen because it is a standard accounting method, widely used in

business and industry, and because it is an appropriate method by which to evaluate the searching procedure. In this method standard searching times and standard rates of pay are established and then compared with actual times and actual rates of pay on a per item basis. The standard time is standard in the sense that it is an average time; no arbitrary times are used. The time variance method yields tables that show standard times and real times for each of the tools in which the item was searched. Since time is the primary unit of data, the authors feel other libraries will be able to apply their particular rates of pay to the data and thus determine their own costs of searching. Such tables are readable and meaningful once the basic principles of the method are understood. The authors feel that cost, determined in this study as a function of time and rate of pay, will suffice to show the most inexpensive method of searching.

Tools Used in the Study

Three tools were chosen for study and comparison: the NUC; the ELBT[16]; and the LC NPAC depository card set (which shall hereafter be referred to as the "Title II file") arranged by title, located at the Norlin Library, University of Colorado, Boulder, Colorado. This Title II file also contains a negligible number of cards for items cataloged originally at the Norlin Library. The NUC and the Title II files were chosen because they are standard tools used by many libraries in their bibliographic searching operations. The Title II file, of course, is influenced by local filing, exclusion and weeding practices, but basically a Title II file arranged by title is a Title II file arranged by title.[17] The ELBT, probably

the littliest known and least used of the three tools, was chosen because it offers the location of LC cards by title in books catalog form. Moreover, since the ELBT uses the same font as the NUC, card reproduction facilities used for the NUC can also be used for card reproduction from the ELBT.

The NUC contains all catalog cards printed at the Library of Congress for monographs and serials cataloged by the Library of Congress as well as union catalog entries for the same types of items. The NUC is published monthly with three quarterly cumulations which are then replaced by annual cumulations at the end of the year except at the end of each fifth year when a quinquennial cumulation replaces the four previous annual cumulations along with the monthly and quarterly catalogs of the year immediately preceding the quinquennial cumulation. Thus, when the December issue appears, the searcher must search through at least six catalogs (three quarterly and three monthly) to cover that single year. Since quarterly cumulations are slow in appearing and since the yearly and quinquennial cumulations do not begin to appear for some months into the next year, it is not unusual that more than six NUC catalogs must be searched. For example, at the time of this writing, searchers at Penrose Library must search for an item published in 1972 through nine NUC catalogs--three 1972 monthlies, three 1972 quarterlies and three 1973 monthlies (the March 1973 quarterly has not yet appeared and the first volumes of the 1968-1972 quinquennial set are not expected until the end of the year).

When the study began, items were searched through any of the appropriate NUC catalogs held by Penrose Library at that time. They

are:

1969 - yearly cumulation

1970 - yearly cumulation

1971
- Jan.-March - quarterly cumulation
- April-June - quarterly cumulation
- July-Sept. - quarterly cumulation
- Oct.
- Nov.
- Dec.

1972
- Jan.-March - quarterly cumulation
- April-June - quarterly cumulation
- July
- August

During the course of the study, the July 1972 and August 1972 monthlies were superseded by the September 1972 quarterly and the October 1972, November 1972 and December 1972 monthlies were received. Since the study was done under normal working conditions, items were searched through appropriate NUC catalogs available at the time of any particular search. The NUC is alphabetically arranged according to LC rules for filing.

The ELBT contains all Library of Congress NPAC depository cards for books and serials in the English language for 1969 through 1971, arranging them by title. The card is not altered in any manner, hence the main entry still appears on the card although it is disregarded for arrangement purposes except when it is a title main entry or when it is used for sub-arrangement where more than one item have identical titles. The filing order of the cards follows the rules

outlined in the introduction to the ELBT (See Appendix F, p. 118). The ELBT was originally scheduled to be published in three quarterly issues and one yearly cumulated set each year. Apparently due to lack of interest in the tool, no quarterly issues for 1971 and 1972 were ever published. Thus the ELBT now consists of one 1969-1970 basic set and one 1971 yearly set. As of early spring of 1973, Gale Research, publishers of the ELBT, was trying to decide whether or not to publish a 1972 yearly set. Since no 1972 volumes have been received at Penrose Library as of late July of 1973, it is probable that publication has been indefinitely postponed.[18]

Hypothesis and Operational Definitions

The hypothesis of this study is that bibliographic searching by title takes less time than bibliographic searching by main entry. A corollary hypothesis of this study is that bibliographic searching by title is less costly than bibliographic searching by main entry. "Bibliographic searching by main entry" is defined as 1) looking for a match for a particular item in the NUC from the most recent NUC catalog through the 1969 annual cumulative volume on the basis of preselected possible main entry or main entries; and 2) looking for a match for a particular item in the NUC from the earliest appropriate catalog to the most recent on the basis of preselected possible main entry or main entries. A search is ended when the 1969 volume is closed, when the most recent NUC catalog is closed, or when a match is found. A flowchart of bibliographic searching by main entry is given in Appendix B, Flowchart II, p. 98. Time is measured by a stop-

watch started by the searcher himself when he opens a particular NUC catalog and stopped by him when that catalog is closed. This process is continued until all appropriate catalogs have been searched or until a match is found. "Bibliographic searching by title" is defined as 1) looking for a match for a particular item in the ELBT in the 1971 annual cumulation and then the 1969-1970 basic set or vice-versa (depending on the imprint date) on the basis of a title taken from a title page or represented as being a title on a request form and 2) looking for a match for a particular item in the appropriate catalog drawer of Norlin Library's Title II file. Flowcharts of bibliographic searching by title in the ELBT and the Title II files are given in Appendix B, Flowchart I, p. 97 and Flowchart III, p. 99, respectively. In the case of the ELBT, time is measured by a stopwatch started by the searcher himself when he opens a particular volume and stopped by him when that volume is closed. This process is repeated for the other appropriate volume if a match is not found in the previous volume. In the case of the Title II file, time is measured by a stopwatch started by the searcher himself when he pulls out the appropriate Title II file drawer and stopped by him when that drawer is pushed back into the cabinet or when a match is found. In cases where the drawer has to be entirely removed from the cabinet, time is measured by the searcher himself when he begins manipulating the cards in the drawer and stopped when he ceases to manipulate cards or when a match is found. Cost is defined as time used in searching multiplied by $/sec.

Limitations of the Study

There are four major limitations to this study. First, it is directly relevant only to those libraries that search the NUC for LC copy or information in the course of their searching and/or pre-cataloging processes. Although no figures or estimates have been found in print concerning the number of libraries using such a method, there is a general opinion among members of the profession here at the University of Denver that enough medium to large sized public and university libraries do rely on this method to make the study useful within the profession.

A second limitation is the restriction of items searched to items not excluded from Norlin Library's Title II file as determined by their exclusion policy.[19] This is a self-imposed limitation so that the Title II file can be used to measure time in real title searches rather than relying on a methodology that would only simulate a title search. Moreover, the Norlin Library's policy does not exclude such a large variety of types of cards that large numbers of cards would not be included in the file.

A third limitation is that, since the study was done in a particular library, the nature of the items available for searching--i.e., those acquired by Penrose Library--may not reflect the nature of items acquired by all libraries using this type of searching and/or pre-cataloging. The problem here is greatest, perhaps, in public libraries that tend to acquire heavily in popular fiction and popular non-fiction--both being areas where items tend to have an obvious single author and hence an obvious single main entry possibility.

The fourth and perhaps most serious limitation is that the

selection of possible main entries or main entry was done subjectively by five bibliographic searchers, including the authors of this study, all employed in the Acquisitions Department of Penrose Library. Such subjectivity in selecting possible main entries or main entry may result in bias. Since these searchers each have one to three years experience in searching, they are assumed to be competent and hence any resulting bias is non-systematic.

CHAPTER II

DATA ANALYSIS

Sample Description

The total number of samples is 771. Of the total, 307 were searched in ELBT, 771 in NUC and 771 in Title II. The ELBT sample consisted of 125 requests, 161 monographs, and 21 serials. The T II and NUC sample consisted of 177 requests, 572 monographs, and 22 serials. All three types of library materials (requests, monographs, and serials) were treated identically in the searching process.

Time Analysis

In order to describe and compare the amount of time involved in searching, it is best to express first the information gathered from Tables 1, 2, and 3 (see Appendix A, pp. 32-98) in tabular form.

Table I

	Total Time in hrs.	Total No. of Items	No. of Entries	Successful Match
ELBT	1.56	307	310	148
NUC*	9.62	307	441	215
T II*	1.03	307	310	215

*These data elements apply only to those same 307 items searched in ELBT.

Table I shows that the least time was taken when searched in T II, and that the most time was taken in NUC. There is little

appreciable difference between time taken in ELBT and T II, the difference being .53. However, using the main entry approach in NUC resulted in a difference of 8.59 when compared to T II and 8.06 when compared to ELBT. Therefore, searching by main entry resulted in 89.3% more time than T II title entry searching and 84.8% more time than ELBT title entry searching.

In searching, a perfect match for the item is also desired. If one takes this into consideration, the success of finding a perfect match was 27.3% higher in the title access tools.

Table II

	Total Time in hrs.	Total No. of Items	No. of Entries	Successful Match
NUC	23.74	771	1224	229
T II	3.03	771	784	361

Table II shows that the least time was taken when searched in Title II, and that the most time was taken in NUC. The table also indicates that for the same number of items (771) searching through the Title II was 87.1% faster than searching in the NUC and that the success of finding a perfect match was 36.6% higher in Title II than in NUC.

Cost Analysis

The cost analysis is to be carried out by the time variance method. This method is employed by cost accountants to determine overhead variances for budget control and product costing.[1]

The following definitions should preface an explanation of the actual methodology in using this technique.

Variable cost - "A cost which is uniform per unit, but which fluctuates in total in direct proportion to changes in the related total activity or volume."[2]

Standard cost - "A carefully predetermined cost that should be attained. Usually expressed per unit."[3]

Variance - "The deviation of actual results from the expected or budgeted result."[4]

Usage variance - "The standard price for a given resource, multiplied by the difference between the actual quantity used and the total standard quantity allowed for the number of good units produced."[5]

Efficiency variance - "Usage variance applied to labor and variable overhead."[6]

Before this method is employed one must establish a standard cost. The following is an explanation of this procedure.

Standard Cost

The

Standard Cost = Standard Rate of Pay × Standard Time.

	Rate of pay in $/mo.		Hours/wk.
Searcher A	$326	@	40
Searcher B	$340	@	32.5
Searcher C	$340	@	40
Searcher D	$340	@	32.5
Searcher E	$340	@	32.5
Totals:	$1,686/mo.		172.5 hrs/wk.

Reducing to like units expressed in dollars per second we have

Standard Rate of Pay = $.000625/sec.

The sample was then separated by person. Using the weighted average method, an average time was taken for each searcher per searching method. This resulted in the following standard times

NUC

$$\text{Searcher A} = \frac{1944.9 \text{ (total time in sec)}}{25 \text{ (no. of items)}} = 77.7 \text{ sec/item} \quad .$$

Similarly,

$$\text{Searcher B} = \frac{6753.5}{43} = 97.0 \text{ sec/item}$$

$$\text{Searcher C} = \frac{4560.6}{47} = 97.0 \text{ sec/item}$$

$$\text{Searcher D} = \frac{12446.0}{182} = 68.4 \text{ sec/item}$$

$$\text{Searcher E} = \frac{39771.4}{474} = 126.1 \text{ sec/item} \quad .$$

An average of these times gives us the

Standard Time = 93.2 sec/item

and

Standard Cost (NUC) = \$.058/item

Similarly, other standards were established for T II where

Standard Cost (T II) = \$.009/item.

After removing those samples which were not valid, a similar technique was employed which yielded a

Standard Cost (ELBT) = \$.011/item .

To recapitulate,

Standard Cost (NUC) = \$.058

Standard Cost (T II) = \$.009

Standard Cost (ELBT) = \$.011 .

Now that a standard cost has been established let us take the item number A1 and show how Tables 1, 2, and 3 of Appendix A (pp. 32-98) were computed.

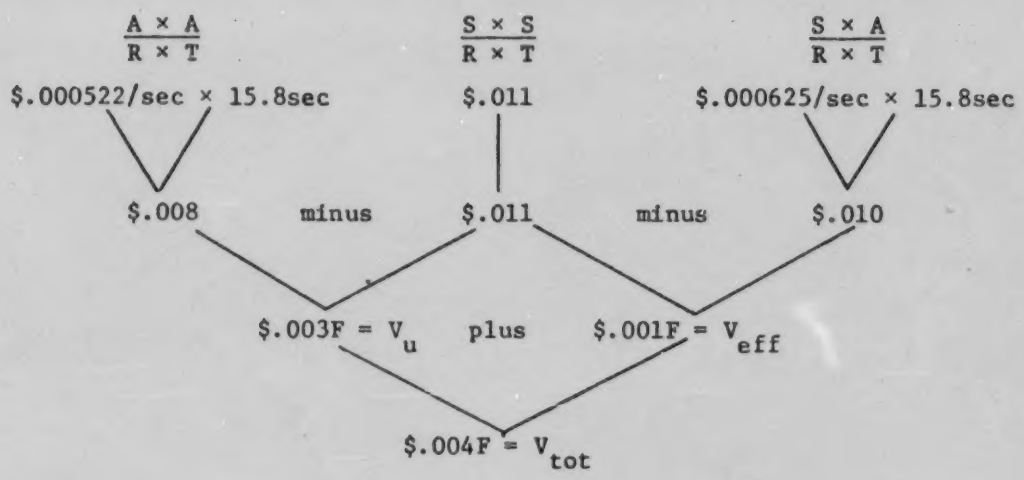
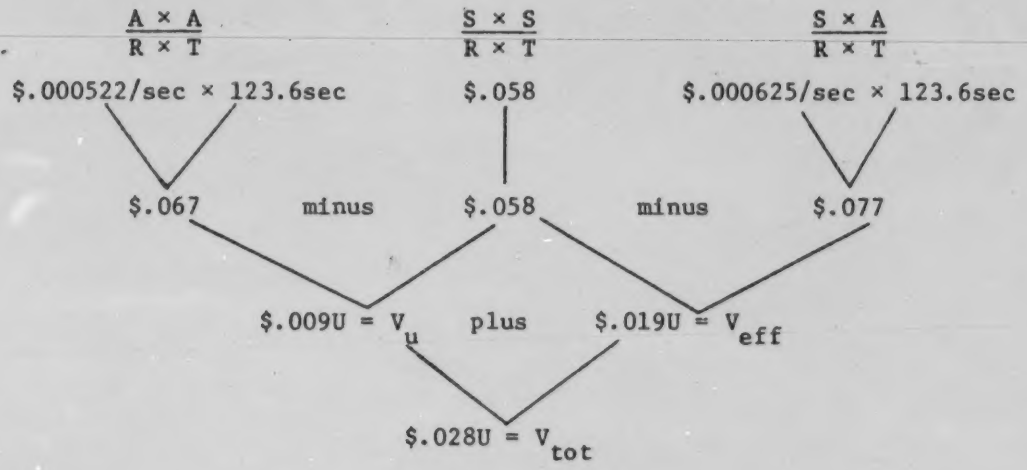
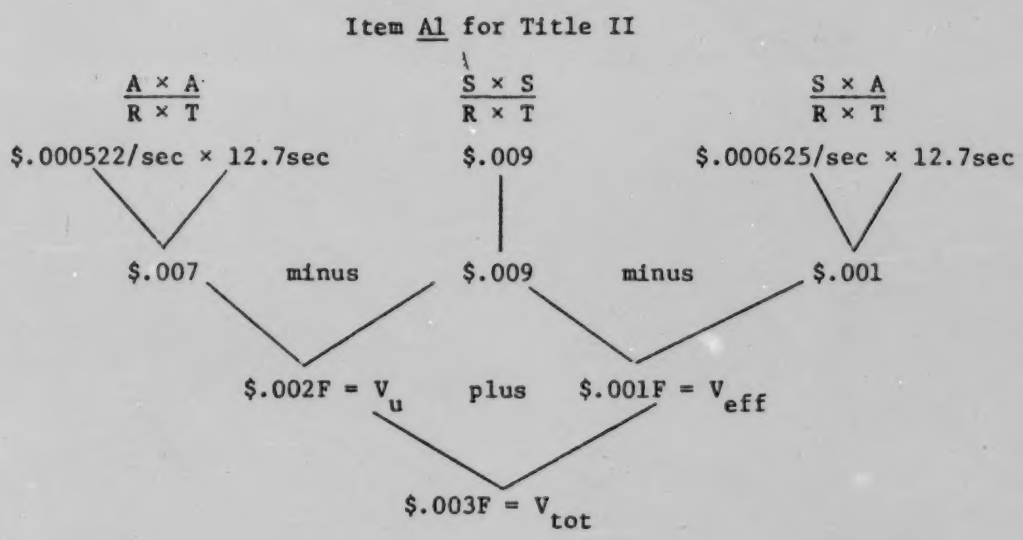
This document was processed for the ERIC Document Reproduction Service by the ERIC Clearinghouse at Stanford. We are aware that some pages probably will not be readable in microfiche or in Hardcopy form. However, this is the best available copy, and we feel that the document should not be withheld from interested readers on the basis of these unreadable pages alone.

Item A1 for ELBT



Item A1 for NUC





Where

R = Rate of Pay in dollars per hour; T = Time in minutes taken for each search; U = Unfavorable; F = Favorable.

The variance is favorable if and only if the variance is less than the standard cost. The variance is unfavorable if and only if the variance is greater than the standard cost. The usage variance is equal to the absolute value of the standard cost minus the actual cost. The efficiency variance is equal to the absolute value of the standard cost minus the standard rate multiplied by the actual cost. Total variance is equal to the sum of the usage variance and the efficiency variance. The total variance is favorable if both the usage variance and the efficiency variance are favorable. The total variance is unfavorable if the efficiency variance and the usage variance are both unfavorable. If the usage variance and the efficiency variance differ in favorability, the two are subtracted and the larger determines the favorability or unfavorability as shown in the example above.

Table III

	Cost	V_u	V_{eff}	V_{tot}
NUC	$58.682	$15.356U	$10.820U	$26.176U
T II	$ 7.461	$ .621U	$ .074F	$ .547U

It is quite evident that if it costs $58.68 to search by main entry and $7.46 to search by title for the same number of items that searching by title in this study costs less than searching by main entry. How much less -- $51.22 less or in our case $.07 less per item.

Also, an efficiency expression of $.074F as compared with $10.82U can lead one to deduce that title entry searching is more efficient than main entry searching even though both methods are unfavorable when considering the total variance.

Sources of Error

There are no calculations in the time analysis to correct for dealing with the book catalog (NUC) and card catalog (T II). Such an operation is not within the scope of this study. The cost analysis by time variance method will correct for competencies of the various searchers which is the major source of variability in this study.

The amount of error due to regular stochastic processes is calculated in the following manner

$$SD = \sqrt{V_{tot}}$$

where

SD = Standard deviation

V_{tot} = total variance .

Therefore the

$$SD_{(ELBT)} = \sqrt{.604U}$$
$$\approx .8$$

$$SD_{(NUC)} = \sqrt{26.176U}$$
$$\approx 5$$

$$SD_{(T\ II)} = \sqrt{.547U}$$
$$\approx .7 \quad .$$

This results in an error possibility of 21.9% for ELBT, 18.9% for NUC and 9.3% for Title II.

CHAPTER III

CONCLUSIONS

Limitations imposed on the study do not reflect their sources of error as strongly with a larger and more representative sample. The authors feel the size of the sample enables them to be more conclusive in making statements about the two methods of searching.

This study has achieved its goal in that it has shown under the conditions and methodology previously indicated that main entry searching is more time consuming than title searching and that it is also more costly.

The question now arises as to which bibliographic tool libraries might use. Unfortunately, the publication of ELBT has been postponed indefinitely.[1] This leaves libraries with the choice of the NUC and T II. The cost of the NUC is $730/yr and $675 for the annual cumulation for a total of $1405/yr.[2] The University of Colorado Libraries estimates their cost of maintenance at $4,000/yr.[3] When one considers that searching the T II is 89.3% faster and that the success in finding a perfect match is 27.3% higher, libraries must decide their priorities and choose the method most applicable to their library situation.

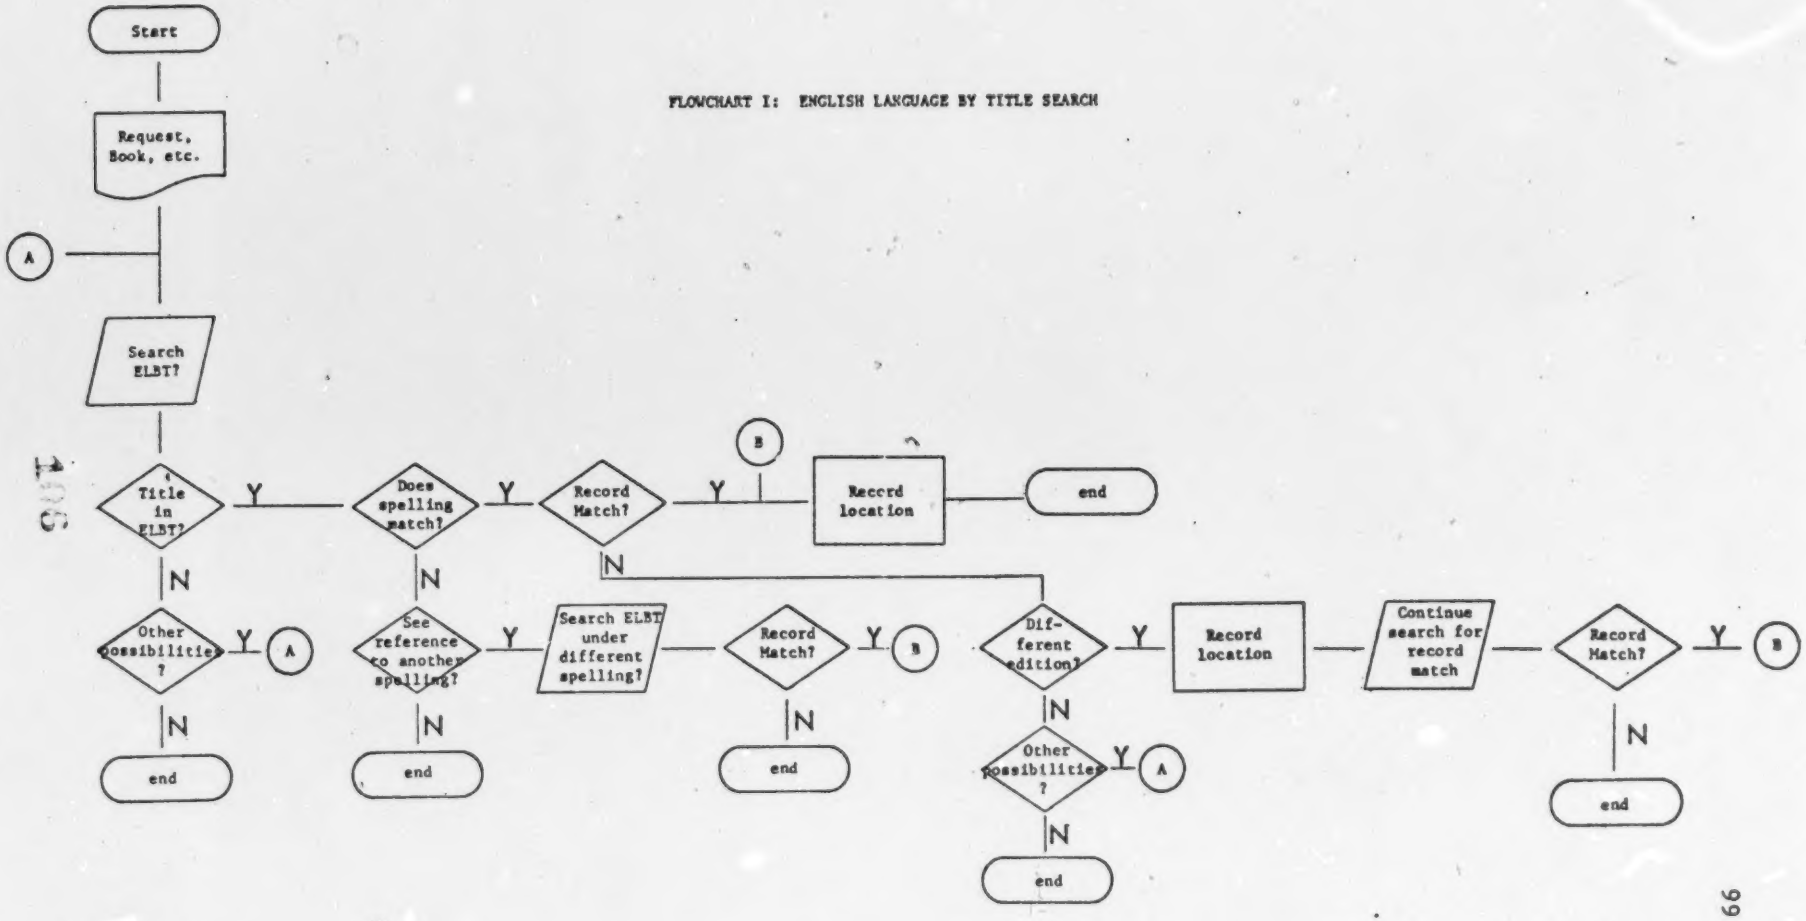
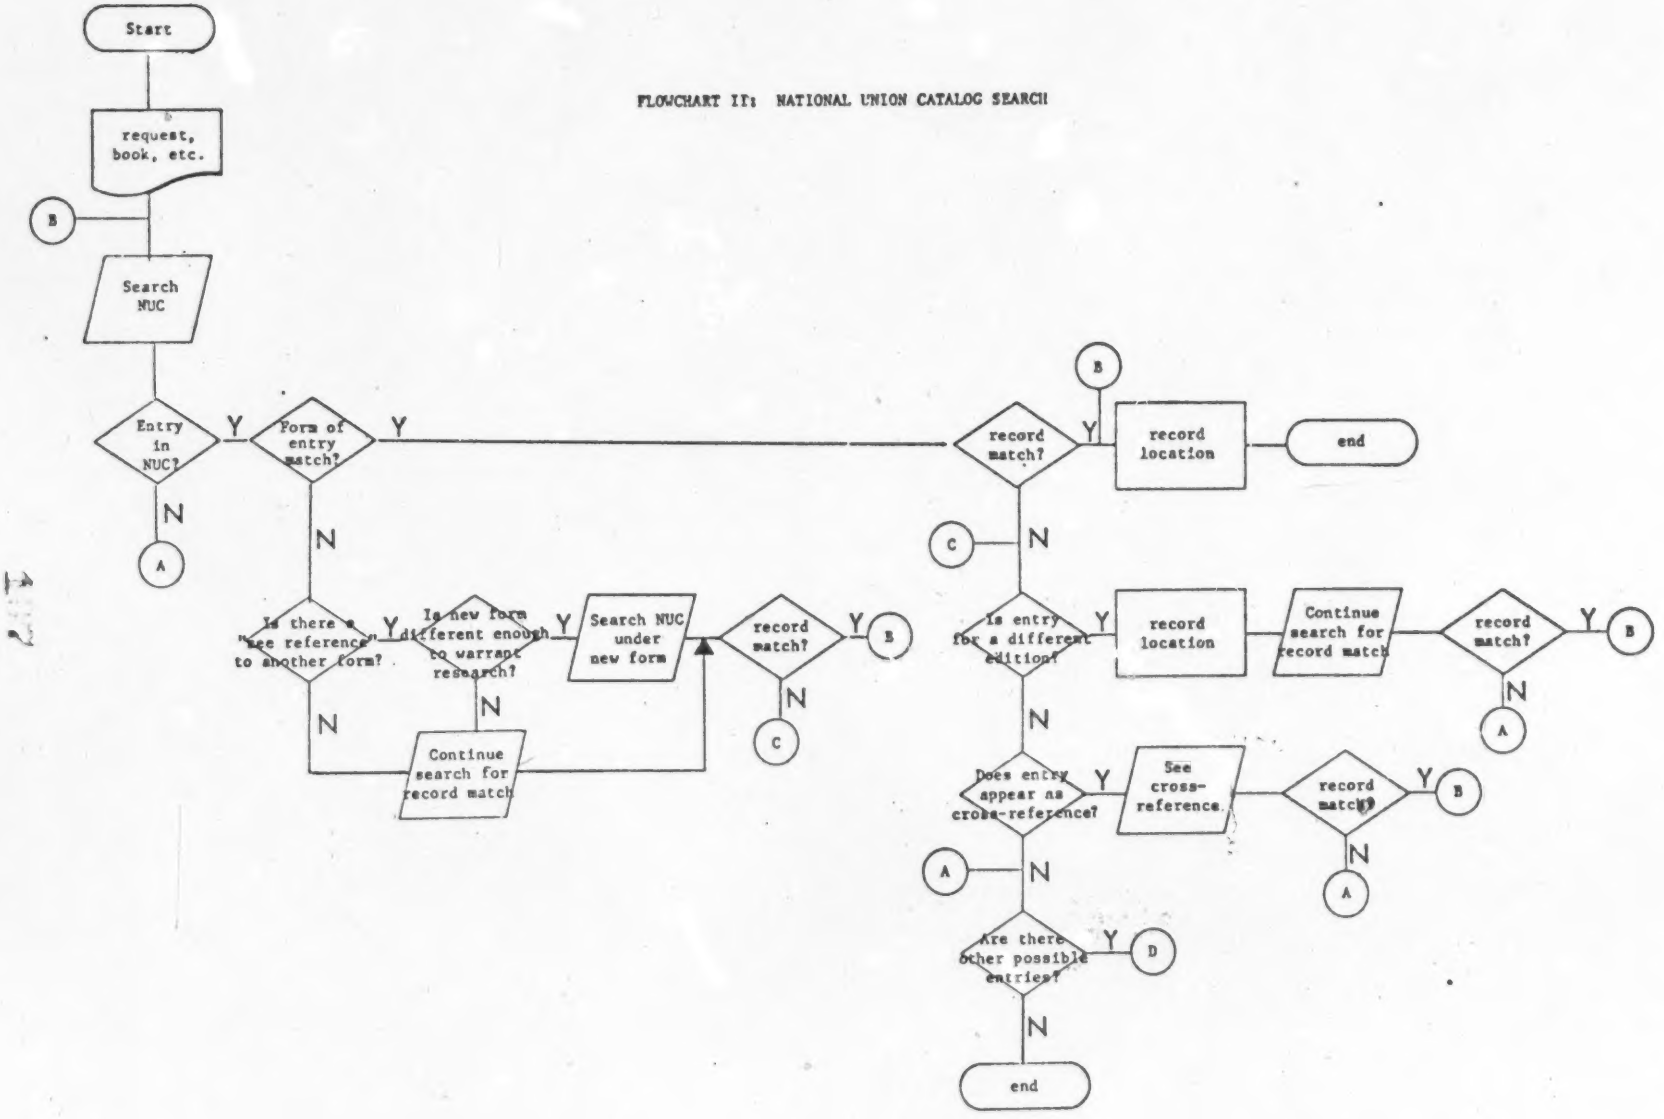
APPENDIX B

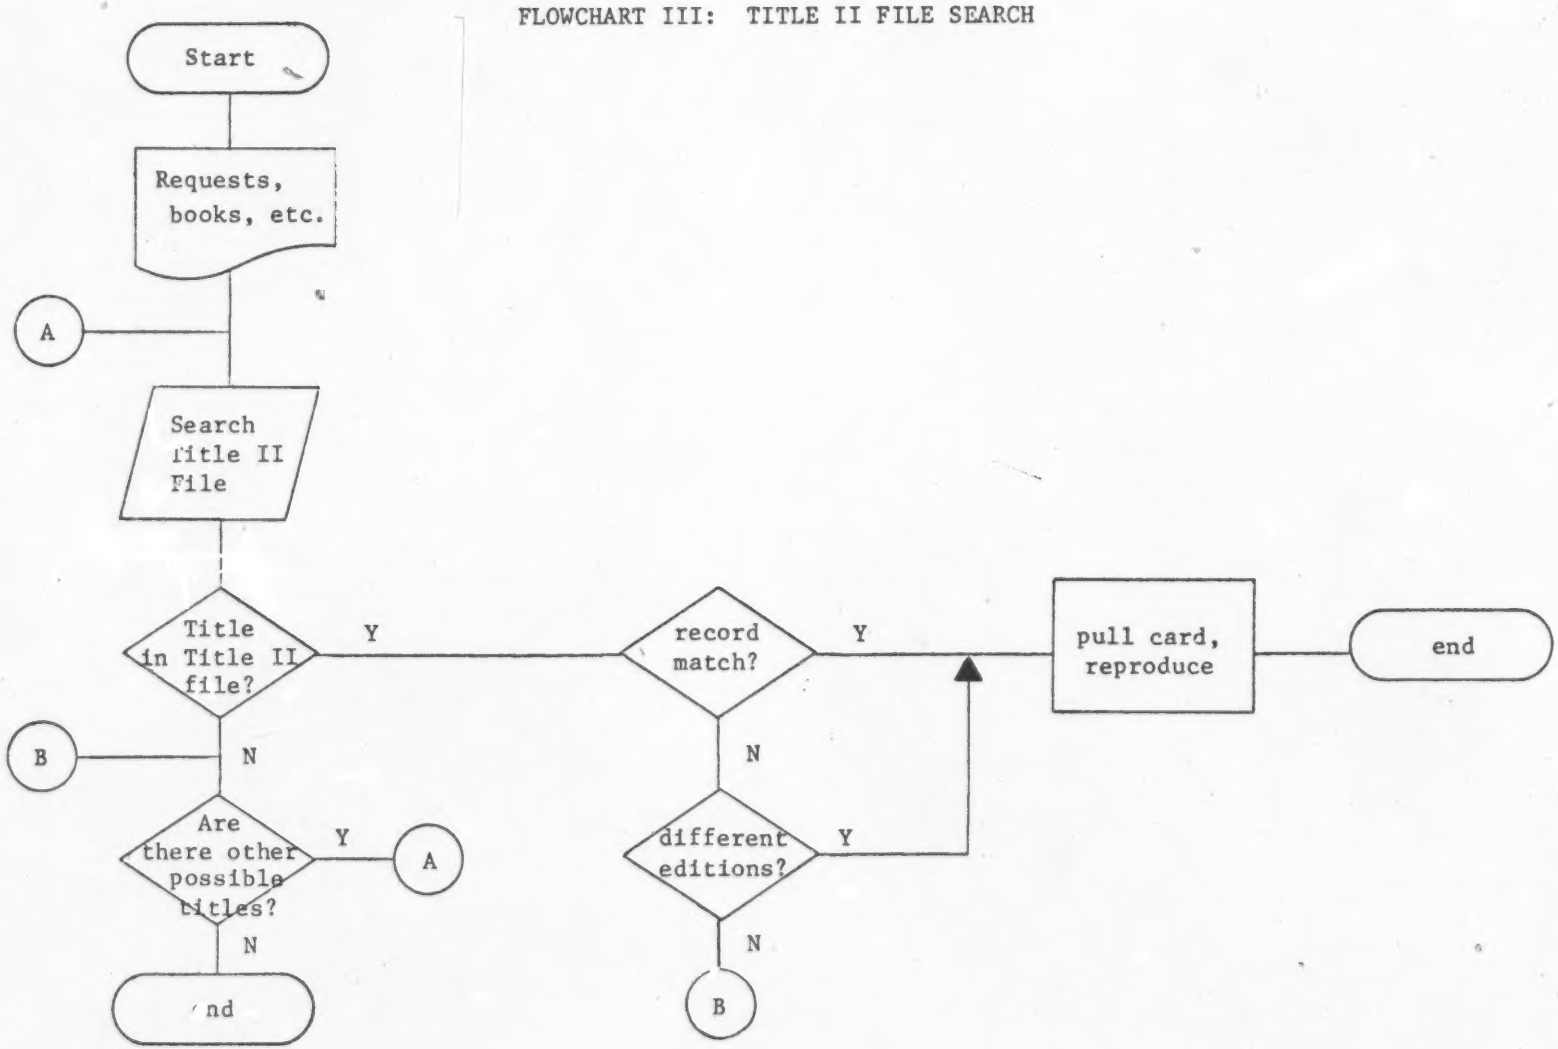
FLOWCHART I: ENGLISH LANGUAGE BY TITLE SEARCH



FLOWCHART II: NATIONAL UNION CATALOG SEARCH



FLOWCHART III: TITLE II FILE SEARCH



APPENDIX C

SEARCH RULES

Objectives: To know

1. what was searched.
2. the time required for the search.

General Instructions:

1. Search time will be taken for the NUC only.
2. Record all times in the appropriate squares provided on the search slip.
3. Any search timed that you feel is appropriate and for which a square has not been provided, should be recorded on the back of the search slip with an explanation of what was searched.
4. When a perfect LC match is found, mark the appropriate box with a check after you record the time.
5. Any further questions should be directed to Tom Connole or Richard Ortiz.
6. Attach all search slips to the item searched.

Search Methodology:

1. Search as you would normally search the item, but be consistent (e.g., if you normally search forward through the monthlies and quarterlies, always search forward through the monthlies and quarterlies).
2. Each entry possibility is considered distinct and should be entered on a separate search slip with specific timing for that possibility (e.g., x-references will be considered another possibility and will be timed appropriately).

Timing Methodology:

1. Start the stop watch when opening a specific volume or when starting to leaf from one point within a volume to another point within the same volume.
2. Stop the stop watch when useful copy or cross reference is found (do not include time taken to record the location) or when you are convinced there is no useful copy at that point (do not include time taken to record the failure to locate useful copy).
3. Wear the stop watch where it is most comfortable, but be as consistent as possible.
4. Do not include any travel time -- i.e. the time taken in replacing and obtaining volumes from the shelf.

Thank you,

Tom Connole and Richard Ortiz

APPENDIX D

PROCEDURE FOR NEW L.C. PROOF

1 Feb 71

1. Sort

I. Discard

A. Motion pictures and film strips: denoted by the word motion picture or the word filmstrip in italics.

B. Cross references: denoted by the word see between two entries or X in the lower right-hand corner.

C. BF, Q, R, S, T, U, V call numbers in all languages except English, French, and German.

D. Cards for all titles not in Roman alphabet and cards for all titles in Slavic languages (Russian, Polish, Yugoslavian, etc.) and Eastern languages (Turkish, Indonesian) and Rumanian language and Scandinavian languages (Norwegian, Swedish, Finnish, Dutch (the Netherlands)).

1. These languages can be recognized by the place of publication or the L.C. designation. When making a decision let the language of the title have priority in decision making. The place of publication of L.C. designation may not coincide with the language of the title in some cases and should be used only as an aid when in doubt.

II. Keep

A. In other words keep only English, French, German, Spanish, Portuguese, Italian and Latin language titled cards. Also, Q, R, S, T, U, V and BF call numbers in English, French and German. All other titles in all other languages can be discarded.

III. Remaining cards are separated according to the following:

A. Government Documents: those cards authored by the U.S., United Nations and Colorado.

1. In addition, U.S. cards must have been published by the U.S. Government Printing Office.

2. Note: Follow the above rules for sorting government documents, i.e. discard cross refs. Also separate government document information cards.

B. Music

1. Phonodiscs and records: denoted by phonodisc or record in italics.

2. M call numbers:
Example: M801.B4 not MN, ML, etc.

C. Information cards

D. Phonotapes: denoted by phonotapes in italics

E. "Our proof" (As in II. above).

IV. Next

A. Send phonotapes to audiovisual, government documents and music to their libraries.

B. First letter information cards and leave in an accessible place.

C. Tickometerize the other cards as follows:
   1. Proof sheets to be dated: our proof, music, gov. docs.
   2. Proof sheets to be green stamped: our proof, gov. docs.
   3. Proof sheets to be speed striped: our proof, music, gov. docs.

PROCEDURE FOR PREPARING MASTER FILES AND REFILES

1. Remove (peel off labels and liquid paper typing) any location notes and/or library designation (CoU) appearing below the call number.
2. Check front of cards for Microforms, designated by the word Microform in the call number position, and theses, designated by initial call line of T1953-date. Check verso for recats and transfers, designated by abbreviation r or tr before the cataloger's initials; cancel with a vertical line any uncancelled request lines; and line through any uncancelled B's (abbreviation for bindery) Microforms, theses, recats and transfers are to be returned to Roz.

PROCEDURE FOR NEW L.C. PROOF

28 Jan 72

Sorting

I. Keep

A. All English, French, and German language titled cards.

B. Spanish, Portuguese, Italian, and Latin language titled cards for all call numbers except BF, Q, R, S, T, U, and V.

C. Government Documents: those cards authored by the U.S., United Nations, or Colorado.

1. In addition U.S. cards must have been published by the U.S. Government Printing Office in order to be sent to Gov. Doc.'s. Those cards not published by the U.S. Gov. Print. Office are kept but are filed in the proof/master file.

2. Discard X-references for documents. Separate government document information cards and file with the other information cards.

D. Music

1. phonodiscs, phonotapes, and records: denoted by the word phonodisc, phonotape, or record in italics or by an M or R in the lower right-hand corner of card.

2. M call numbers:
Example: M801.B4, not MN, ML, etc.

E. Information cards

II. Discard

A. Motion pictures, film strips, and microfilm: denoted by the word motion picture, filmstrip, or microfilm in italics or by an F in the lower right-hand corner of the card.

B. Cards for all titles not in Roman alphabet, Slavic languages (Russian, Polish, Yugoslavian, etc.), Eastern languages (Turkish, Indonesian), African languages. Romanian language, and Scandinavian languages (Norwegian, Swedish, Finnish, Danish and Dutch (the Netherlands).

1. These languages can be recognized by the place of publication or the L.C. designation. When making a decision let the language of the title have priority in decision making. The place of publication or L.C. designation may not coincide with the language of the title in some cases and should be used only as an aid when in doubt.

III. Next

A. Tickometerize the remaining "keep" cards as follows:

1. Proof sheets to be dated: our proof, music, gov. docs.

2. Proof sheets to be green stamped: our proof, gov. docs.

3. Proof sheets to be speed striped with current color: our proof, music, gov. docs.

B. Put Music (i.e., phonodiscs, phonotapes, records, M call numbers) and Gov Doc. cards in appropriate boxes. (Cards are sent once a week to the libraries).

C. First letter information cards and file in the boxes on shelves behind LAIII's desk.

D. First letter and pre-file our proof, keeping each letter rubber-banded together separately.

PROCEDURE FOR PREPARING MASTER FILES AND REFILES

1. Remove (peel off labels and liquid paper typing) any location notes and/or library designation (CoU) appearing below the call number.
2. Count master files and refiles separately and record numbers in blue ring binder.
3. Combine refiles and masterfiles and prefile and distribute.

APPENDIX E

FILING RULES FOR
TITLE ARRANGEMENT
OF
PROOF/MASTER FILE

University of Colorado
Norlin Library
Technical Services Division

April 1972

FILING RULES FOR TITLE ARRANGEMENT OF PROOF SHEETS

I. Basic rule

A. Arrange all entries by title, both English and foreign language, alphabetically according to the order of the English alphabet. All non-Roman alphabets are to be arranged by the romanized form. Card in the Cyrillic alphabet usually have the title transliterated in the lowerright hand corner.

B. Arrange word by word, alphabeting letter by letter within the word. Apply the principle of "nothing before something," considering the space between words as "nothing."

EXAMPLE:

New Amsterdam	NOT	New Amsterdam
New England		Newark
New wives for old		New England
Newark		Newman
Newman		New wives for old

C. Disregard the modification of all letters, including the umlaut. Arrange ä, à, á, ē, ī, ö, ø, ü, as a, e, i, o, u; ç, ć, č, ł, ñ, š, ž, as c, l, n, s, z.

Icelandic and Anglo-Saxon:
Ð ð ꝺ File as d
Þ þ (Thorn) File as th

D. Arrangement of identical titles:
Arrange all titles, whether title main entry or not, in the following order:
1. Title.
2. Main entry (skip this step if title is a title m.e.)
3. Date of publication (reverse chronological order)
4. Place of publication (alphabetically, i.e., London precedes New York)
5. Publisher (alphabetically, i.e., Macmillan precedes Scarecrow)

E. Disregard any printed filing titles that may appear on proof sheets.

II. Signs and symbols

A. Signs at the beginning of a title, such as ..., or ---, are to be disregarded, the title being arranged by the word that follows the signs.

B. Ampersand and other symbols
Alphabet the character "&" as "and", "et", "und", etc. according to the language used. c/o as "in care of", w/ as "with", w/o as "without," @ as "at".

III. Initials

A. Arrange an initial before a word beginning with the same first letter.

B. Arrange initials standing for names of organizations, broadcasting stations, etc., whether punctuated or not, as initials and not as abbreviations, i.e., not as if spelled out in full.

C. Note that initials are often written without periods, and sometimes in lower case or a combination of caps and lower case, rather than all caps.

D. Acronyms

1. File as a word when written with a combination of caps and lower case: Agard, Algol, Cobol, Snobol, Fortran, Nato.

2. File as initials when written in all caps, whether there are spaces and/or periods between the letters or not: NATO, U.N.E.S.C.O., S E A T O, SAC.

IV. Abbreviations

A. Arrange abbreviations as if spelled in full; e.g., Dr., Mr., Mrs., Mlle., S., Ste., etc., as Doctor, (or in German, Doktor), Mister, Mistress, Mademoiselle, San or Sanctus, Saint, Sainte, etc. Also Ha (Greek 'A) as Hagios. This includes initials and other abbreviations used for geographical names; e.g., N.Y., as New York, Gt. Brit. as Great Britain.

B. Disregard the abbreviations k., K.K., I., R., etc. (standing for Kaiserlich, Königlich, Imperiale, Reale, etc.) at the beginning of names of foreign learned academies, societies, etc., and arrange by the word following the abbreviations. The words for which these abbreviations stand are not familiarly known or spoken as part of the name. In the names of English societies, Imperial and Royal are not to be disregarded.

V. Elisions

Arrange elisions as they are printed and not as if spelled in full. Treat as one word the contraction of two words resulting from an elision. Example: can't, don't. Exception: Foreign articles and prepositions with a final vowel elided are to be treated as separate words and not as contractions.

EXAMPLE: Bibliothèque d'anthropologie
Bibliothèque d'histoire

Bibliothèque de la révolution
C'est
Cap'n Eri
Capo d'anno
De l'intelligence
De la vida internacional
Flower o' the lily
Flower of destiny
Who is who in literature
Who'd be king
Whom the gods destroy
Who's who
Whose home is the wilderness

VI. Initial article

A. In alphabeting titles, disregard an initial article regardless of case in all languages. (See Appendix A - Articles to be disregarded).

B. In case the form of the indefinite article is the same as that of the numeral "one" (e.g. the French "un" or "une") care must be taken to distinguish the use, because the numeral is to be regarded in filing.

VII. Punctuation marks. Possessive case, etc.

In alphabeting titles, ignore commas, colons, and semicolons. File until you come to a period or a question mark, unless the title contains an author statement.

EXAMPLE: Arctic adventure, by Henry Wilson. In this case, stop after the title; that is, after adventure. This holds true for all languages. Even if you are unsure of which words mean by (par, por, von, de), you can tell by the form: title, comma, short word, author's name.

VIII. Numerals

A. Numbers at the beginning of titles will file before initials, at the beginning of the alphabet. Ignore transliterations of numbers.

EXAMPLE: 4 [i.e. Quattro] Movimenti per un significato.

file as: 4 Movimenti per un significato.

B. Spelled numbers should be filed alphabetically:
Fourth annual report
Henry the sixth.

C. Interfile cardinal and ordinal numbers.

D. Dates will be regarded as numerals and will be filed in their numerical sequence with other numerals.

E. Numerals will be filed chronologically before alpha characters in the same position.

EXAMPLE: Contratto collettivo nazionale di lavoro 10 giugno 1952.
" " " " " 11 novem 1965.
" " " " " 13 luglio 1967.
" " " " " 25 luglio 1966.
" " " " " manuale.

COMPREHENSIVE EXAMPLE: 4 Movimenti.
5th European Conference.
14-18: the education ...
Die 95 [Fünfundneunzig] Thesen.
300 years
The 1971 encyclopedia ...
2,000 years of art.

IX. Words spelled in two ways.

When title headings begin with a word that may be spelled in two ways, arrange according to the spelling that is given. Do not inter-file titles which have different spellings.

X. Hyphened and compound words

A. Arrange Hyphened words as separate words if the two parts can stand alone.

B. Arrange as one word, compound words that are printed as one.

C. Arrange as one word, words with a hyphened prefix such as anti-, co, electro-, ex-, inter-, mid-, non-, pan-, post-, pre-, pro-, re-, trans-, tri-, etc. These prefixes cannot stand alone as words.

EXAMPLE: folk lore (file as 2 words)
folk-lore (file as 2 words)
folklore (file as 1 word)

XI. Names

A. Names compounded of two words

Arrange names consisting of two or more words, with or without a hyphen as separate words. This includes names beginning with New, Old, East, North, Saint, San, Santa, etc.

B. Names with a prefix

1. Arrange a name with a prefix as one word. This includes names in which an article or a preposition is written as part of the name and is not transposed; such names as ApThomas, D'Arcy, Des Barres, Du Challu, Fitz Allen, (Fitz is regarded as a prefix), Le Sage, L'Estrange, MacFingal, O'Neal, Van Allen, Zum Felde, Zur Brücke, ZuTavern, Kis-Erös (Hungarian), etc.

2. Names beginning with a prefix M' and Mc are filed as if spelled Mac, because they are so pronounced.

C. Oriental names

1. Mohammedan (Arabic, Persian, Turkish) and Hebrew names. Disregard the initial article al- or el- (or the assimilated forms ad-, as-, az-) prefixed to Arabic, etc., names (e.g., al-Ghazzali) and the article ha- or he- prefixed to Hebrew names. But when the article comes between the parts of a name (e.g., 'Abd al Latif) it is to be regarded.

2. Chinese names.
Arrange Chinese names by the first part (family name) whether it is separated by a comma or not. But an old Chinese name that consists of only two hyphened syllables (e.g., Lao-Tzu, "the Old One") is to be filed as a two-word phrase.

D. Names spelled differently

Arrange separately names that differ in spelling however slightly.

XII. General arrangement under title.

A. At the beginning of a title the author's name, even in the possessive case, should be regarded.

EXAMPLE: Byron adaptations.
Byron's Childe Harolds pilgrimage.
Byron's genius.
Byron's poetical works.

B. Editions: Arrange editions of identically worded titles by date, in reverse chronological order, i.e., latest date first.

C. Translations: Arrange each translation alphabetically by its own title.

XIII. Sections which are exceptions to normal filing rules

A. Proceedings.

All titles beginning with the word "Proceedings" and having an author entry will be sub-arranged alphabetically by the author entry. Title main entries beginning with the word "Proceedings" are arranged alphabetically word-by-word in a section following the author/title cards.

B. Works, Poems, Letters, etc.

Several sections of the file will not be arranged word for word. Any title in these sections which has the form: (Poems) of (author's name). will be filed as if there were a period preceding the word "of". These titles will be inter-filed with titles taking the form Poems.

EXAMPLE: Poems of William Wordsworth.
and
Poems. [author on card is Wordsworth]
Inter-file these two titles as if each said Poems.

Sections arranged in this manner include: Complete... (works, poems, etc.), Letters, Oeuvres, Oeuvres complètes, Poems, Poetical works, Report, Werke, and Works.

APPENDIX A

(Modification of American Library Association,
ALA rules for filing catalog cards, 2nd ed.,
Chicago, 1968, pp. 233-236)

INITIAL ARTICLES TO BE DISREGARDED IN FILING

The following table lists definite and indefinite articles in various languages (all genders and both numbers) which should be disregarded. Under each language they are listed in the following order: Singular--masculine, feminine, neuter; Plural--same; an elided form follows its corresponding word or group of words; each article is listed only once under each language. The words in parentheses are variant or dialect forms. An alphabetical index to all articles in the table follows the table.

*Before an indefinite article indicates that the same form is also used for the cardinal numeral "one," therefore care must be taken to distinguish the meaning.

Language	Definite article	Indefinite article
Arabic	al-, el-	none
Bohemian, see Czech		
Bulganian		none
Croatian, see Serbo-Croatian		
Czech (Bohemian)	No articles	
Danish	Den, Det, De(Di)	*En, *Et
Dutch	De, Het, 't, 's	*Een, Eene, 'n
English	The	A, An
Estonian	No articles	
Finnish	No articles	
French	Le, La, L', Les	*Un, *Une
German	Der, Die, Das	*Ein, *Eine,[1]
Greek, Classical (Romanized)	Ho, Hē, Tō, Hoi, Hai, Ta, To	none
Greek, Modern (Romanized)	Ho, Hē, To, Hoi, Hai, Ta,	*Henas(Heis), *Mia *Hena(Hen)
Hebrew (Romanized)	Ha-(Ho-),He-	none
Hungarian	A, Az	*Egy
Idelandic (Modern)	Hinn, Hin, Hio, Hinir, Hanar	none
Italian	Il, La, Lo, I, Gli, Gl', Le, L'	*Un, *Uno, *Una, *Un'
Latin	No articles	
Latvian, see Lettish		
Lettish	No articles	

1. The numerals "Ein" and "Eine" are sometimes spaced (E i n; E i n e) to distinguish them from the indefinite article.

Language	Definite article	Indefinite article
Lithuanian	No articles	
Norwegian (Riksmal)	Den, Det, De	*En, *Et
Norwegian (Nynorsk) (formerly called Landsmal)	Den, Det, Dei	*Ein, *Ei, *Eit
Polish	No articles	
Portuguese	O, A,[2] Os, As[2]	*Um, *Uma
Rumanian		*Un, *Una, *O
Russian	No articles	
Serbo-Croatian	No articles	
Slovak	No articles	
Slovenian	No articles	
Spanish	El, La, Lo, Los, Las	*Un, *Una
Swedish	Den, Det, De	*En, *Ett
Turkish (New)	none	*Bir
Ukrainian	No articles	
Welsh	Y, Yr	none
Yiddish (Romanized)	Der, Di, Die, Dos(Das)	A, An, *Eyn, *Eyne

2. The words "a" and "as" with accents in Portuguese are not articles and must be regarded in filing.

ALPHABETICAL INDEX TO ARTICLES IN ABOVE TABLE

*Before an indefinite article indicates that the same form is also used for the cardinal numeral "one", therefore care must be taken to distinguish the meaning.

A	English, Hungarian, Portuguese, Yiddish
al-	Arabic
An	English, Yiddish
As	Portuguese
Az	Hungarian
Bir	Turkish
Das	German, Yiddish
De	Danish, Dutch, Norwegian(Riksmal), Swedish
Dei	Norwegian(Nynorsk)
Den	Danish, Norwegian, Swedish
Der	German, Yiddish
Det	Danish, Norwegian, Swedish
Di	Danish, Yiddish
Die	German, Yiddish
Dos	Yiddish
*Een, Eene	Dutch
*Egy	Hungarian
*Ei	Norwegian(Nynorsk)
*Ein	German, Norwegian(Nynorsk)
*Eine	German
*Eit	Norwegian(Nynorsk)
El	Spanish
el-	Arabic
*En	Danish, Norwegian(Riksmal), Swedish
*Et	Danish, Norwegian(Riksmal)
*Ett	Swedish
*Eyn, *Eyne	Yiddish
Gl', Gli	Italian
ha	Hebrew
Hai	Greek
Hē	Greek
he-	Hebrew
*Heis	Greek, Modern
*Hen, *Hena, *Henas	Greek, Modern
Het	Dutch
Hið	Icelandic
Hin, Hinar, Hinir, Hinn	Icelandic
Ho	Greek
ho-	Hebrew
Hoi	Greek
I, Il	Italian
L'	French
La	French, Italian, Spanish

Las	Spanish
Le	French, Italian
Les	French
Lo	Italian, Spanish
Los	Spanish
*Mia	Greek, Modern
'n	Dutch
O	Portuguese, *Rumanian
Os	Portuguese
's	Dutch
't	Dutch
Ta	Greek
The	English
To	Greek
To	Greek, Classical
*Um, *Uma	Portuguese
*Un	French, Italian, Rumanian, Spanish
*Un'	Italian
*Una	Italian, Runamian, Spanish
*Une	French
*Uno	Italian
Y, Yr	Welsh

No articles: Czech (Bohemian), Estonian, Finnish, Latin, Lettish, Lithuanian, Polish, Russian, Serbo-Croatian, Slovak, Slovenian, Ukrainian.

APPENDIX F

This document was processed for the ERIC Document Reproduction Service by the ERIC Clearinghouse at Stanford. We are aware that some pages probably will not be readable in microfiche or in Hardcopy form. However, this is the best available copy, and we feel that the document should not be withheld from interested readers on the basis of these unreadable pages alone.

Introduction

Traditionally, and for reasons good and sufficient in themselves, published bibliographies, catalogs, and other records pertaining to books are usually arranged by the established author entry, most commonly by the surname of a person.

The author-entry system has not been without shortcomings, however. Author entry has meant, for example, that the entire bibliographic record is inaccessible if an author's name is lacking, incomplete, or incorrect, even if the title is correct. If there is any doubt about the author's name, or if the work is attributed to a corporate author of uncertain identity, considerable searching is required to locate the entry in question.

In technical processing activities, these drawbacks to the author-entry system have meant that skilled personnel familiar with the possible problems has been required for such activities as searching. It has also meant that duplication of purchases, inaccurate reports of holdings, and other unhappy consequences have sometimes resulted from failure by even experienced librarians to look in just the right place in catalogs or files.

Today, however, this traditional approach is recognized as not necessarily the *only* system, and many libraries, book dealers, and others maintain certain records in title rather than author sequence.

Access by title is possible, of course, in most public catalogs of an individual library's holdings, and in certain published bibliographies, such as *Cumulative Book Index* and *Books in Print*. Valuable as they are, however, these and other records which permit access by title all have individual gaps in coverage (with respect to place or date of publication, type of publisher, etc.) which limit their usefulness.

These volumes of *English Language Books by Title: A Catalog of Library of Congress Printed Cards* represent the beginning of a sustained effort to provide bibliographic control by title on a basis which is both broader in geographic scope and more comprehensive with respect to types of material covered than any existing published record. (The present volumes will be followed by quarterly and annual supplements.)

English Language Content Is Only Criterion

English Language Books by Title is based on Library of Congress printed cards, although LC is not, of course, connected with the publication in any capacity. Specifically, the material in this 1969-1970 cumulation is taken from complete sets of depository cards distributed by the Library of Congress during 1969-70. Cards selected for inclusion in the cumulation pertain to materials believed to be completely or principally in the English language. The place of origin of these materials is *not* a factor in selection for inclusion; works in English are included in *ELBT* regardless of the place of publication.

Similarly, the *publisher* is not considered in selection of items for *ELBT*. Certain types of publications, such as those issued by governmental agencies, associations, state agencies, etc., are omitted from many other bibliographic tools, but are included in *ELBT*.

ELBT includes entries for publications in microform, in addition to entries for books, maps and periodicals. It does *not* include cards for music scores and phonorecords or motion pictures and filmstrips. (Separate volumes covering films and *arranged by title* are published as part of the *National Union Catalog*.)

The *full text* of the Library of Congress card is reproduced in *ELBT*. This means that when an LC entry for a book is found, a catalog card can be prepared *immediately without reference to any other source*. Furthermore, the reduction ratio used is the same as that used in LC's own printed catalogs, and the Polaroid camera and other similar cataloging devices used with LC catalogs are entirely compatible with entries in *ELBT*.

In summary: This publication of 1969-1970 cataloging in title sequence provides an alternative means of access to more than 160,000 English language titles. Included are the following types of material, many of which are not listed in any other source by title:

a) Books and monographs of commercial publishers
b) Publications of university presses
c) Publications of institutes, research units, and other bodies connected with universities
d) Local, state, federal, and foreign government publications
e) Reprinted monographs and other materials
f) Pamphlets
g) Reports and other materials issued by both commercial and nonprofit research centers and by professional conferences, meetings, and symposia
h) Maps, atlases, and gazeteers
i) Microforms
j) Association and society publications
k) Other published materials in English cataloged by the Library of Congress, *regardless of publisher or country of origin*

How Entries Are Arranged

Alphabetical order has, in general, been based on the *Filing Rules for the Dictionary Catalogs of the Library of Congress* (1956). The following are some of the key practices followed:

a) Subtitles which are an essential part of the overall title are taken into consideration in arrangement.
b) When several titles are identical, they are arranged by the author of the work. (This is especially applicable for works with common titles, such as *Report, Transactions, Proceedings, Works*, etc.)
c) Editions of the same work are subarranged by date of publication, then, if necessary, by place of publication and publisher.

d) Titles beginning with initials are placed at the beginning of the letter of the alphabet represented by the first initial of the title.

e) Variant spellings of entry words have usually been interrelated by cross references.

How Title Access Helps Librarians and Researchers

In a survey of the needs of potential users, librarians said that *LLBT* will:

a) Give added flexibility to search and research activities which until now have been handicapped by the almost exclusive use of author names as the basis for organizing catalogs, indexes, bibliographies, etc.

b) Simplify searching and permit use of subprofessionals for this function.

c) Make possible the *immediate* preparation of catalog cards by the Polaroid process or similar methods, once the entry is found, since final printed LC cards are used for compiling *LLBT*. The complete text of LC cards is reproduced, using the same reduction ratio as is used for LC printed catalogs.

d) Provide a means of handling the frequent inquiries concerning books whose authors are not known.

e) Give an alternate point of entry when the title is clearly established but the author is uncertain, or is cited incorrectly.

f) Help eliminate confusion when main entry information in inter-library loan requests does not correspond with main entry established by the lending library.

g) Enable the determination of LC card order number when author entry is in doubt.

The editors believe these expectations will be fully met. They will appreciate learning of other situations in which this comprehensive title catalog is useful, as well as receiving any suggestions as to how it can be made even more valuable.

APPENDIX G

East African Academy.

Human adaptation in tropical Africa; papers presented at a plenary session on the theme "Man in his East African environment" at the fourth symposium of the East African Academy, Kampala, September 1966. Edited by R. J. Olembo. [Nairobi, East African Pub. House [1968]

153 p. illus. 22 cm. 15.00

Includes bibliographies.
